This plot is extremly difficult to understand, it looks like one big blob of data.

```

I notice that these plots have a distinguishable seperation (within reasonable error) of patients with malignant and benign tumours.

19 (see below)

```

```

```r

Q13. Which method gives your favorite results for the same data.dist dataset? Explain your reasoning.

HCsingle <- hclust(data.dist, method = "single")

```r

With this specific analysis the “complete” method gave my favorite results. It provided the cleanest plot and was much easier to use to find the a specific number of clusters (as was asked in question 11).
